

Plan for Radioactivity Measurement (April 2015 thru March 2016)

Revised: March 2015

* Note on change of measurement frequency

The radioactivity for our products and Air Inlet Filter have been monitored, and the measured values kept decreasing for these 4 years, from the highest value detected with Air Inlet Filter right after the earthquake (May 2011). The monitoring result of the product has shown no abnormality during this whole period, thus from now on we will terminate the monitoring for products and instead increase the frequency of monitoring for Air Inlet Filter. Measurement of the product will be immediately resumed if the monitoring value of the Air Inlet Filter is found to exceed the value right after the quake.

Frequency of monitoring: BLUE colored terms were revised as of March 2015.

Product [Before] Every 6 months -> [After] Terminated

Cannula/Component [Before] Simultaneously in every 2 months -> [After] Terminated

Air Inlet Filter [Before] Every 1 year -> [After] Every 6 months

Cleaning Water No Change (no self measurement)
Information from Local Government will be kept reported on the Web every months.

March			5 years since earthquake

● Completed ○ Planned

There is no change in measurement method and actions to be taken at emergency.

All the measurement should be performed by third party laboratory.
Upon recognition of radioactive measure exceeding allowable limit provided by government, it shall be immediately reported to government and customers, and product shipment shall be withheld.
